

Ideas

- LLM Financial News Risk Tagger/analyzer
 - Building a system that reads financial news(or headlines) and turns into structured risk signals
 - Building a multi agent NLP pipeline that reads financial headlines and outputs structured risk tags(maybe including company, event, risk type, severity, time horizon, and reasoning) by chaining an extractor, a risk classifier, and an impact estimator.
 - Or simpler version: financial news headline then the LLM would output (maybe the risk type, event, sentiment, confidence and rationale) and evaluate through performance metrics (accuracy, f1 etc)
- AI travel itinerary generator
 - Build user inputs: dates, countries, budget, activities, food suggestions, events, etc
- E-commerce product comparison
 - Input could be product reviews
 - Output could be : pro/con list, a summary, etc
